- 1. Abdullah Sheikh (CSC-22S-014)**
- 2. Bilal Akmal (CSC-22S-032)**
- 3. Hamza Mujahid (CSC-22S-046)**

Section: 6-A

Subject: Computer Networks

Instructor: Sir Imran Khan

Type: Project Report

Report on VoIP-IP Telephony Networking Project

1. Introduction

The **VoIP-IP Telephony Networking Project** is designed to simulate a real-world telephony system using Cisco Packet Tracer. This project aims to provide an efficient and cost-effective communication network that integrates voice and data services. By leveraging VoIP technology, businesses can reduce telephony costs, enhance scalability, and improve communication efficiency.

2. Objectives

- To design and simulate a telephony network using Cisco Packet Tracer.
 - To demonstrate the integration of VoIP technology with networking equipment.
 - To analyze the cost of implementing this network in a real-world scenario.
-

3. Project Design

Tools Used: -

We used **Cisco Packet Tracer** to design and simulate the project. It allowed us to configure, test, and troubleshoot the network virtually before deploying it in a real-world scenario.

Components Used: -

Below is the list of components used in the project:

1. 4 routers (**2811**)
2. 5 switches (**2960-24TT**)
3. 40 PCs (**PC-PT**)
4. 40 IP phones (**7960**)
5. 4 printers (**Printer-PT**)
6. 4 servers (**Server-PT**)
7. Copper-Straight Through Cables (**97**)
8. 4 Serial DCE-Wires
9. 4 HWIC-2T Modules

Design Steps: -

1. **Network Topology Creation:** Created a topology with routers, switches, PCs, IP phones, printers, and servers.
2. **IP Addressing:** Assigned IP addresses to all devices for seamless communication.
3. **VoIP Configuration:** Configured routers to support VoIP by setting up dial peers and assigning phone numbers.
4. **Testing:** Conducted various tests to ensure connectivity and functionality.

Resources Consulted; -

- **Cisco Packet Tracer Documentation**
 - Online tutorials on VoIP configuration.
 - Networking textbooks and resources from Cisco Networking Academy.
-

4. Cost Analysis

Below is the cost analysis for the components used in the project:

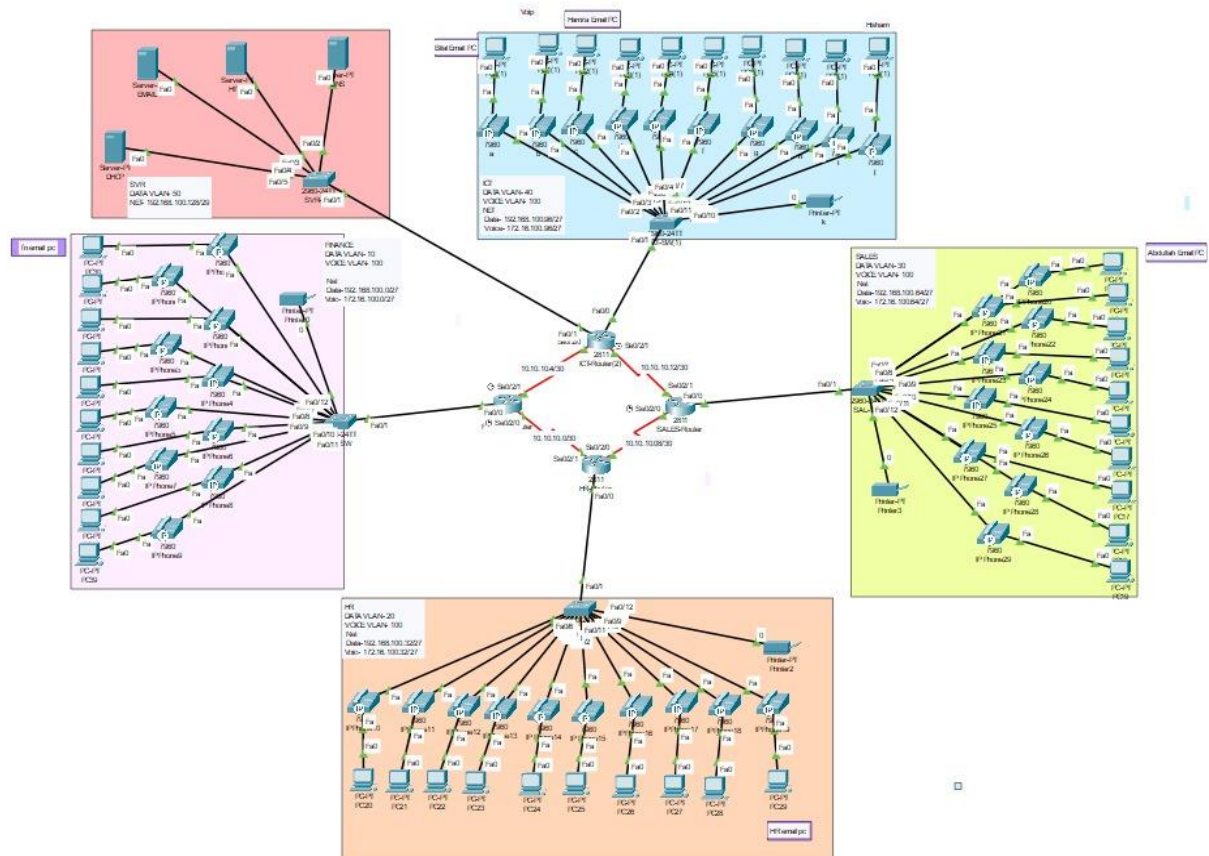

Component	Quantity	Cost per Item (USD)	Total Cost (USD)
Router (2811)	4	300	1,200
Switch (2960-24TT)	5	150	750
PC (PC-PT)	40	500	20,000
IP Phone (7960)	40	200	8,000
Printer (Printer-PT)	4	400	1,600
Server (Server-PT)	4	2,000	8,000
Copper-Straight Through	97	10	970
Serial DCE-Wire	4	50	200
HWIC-2T	4	300	1,200

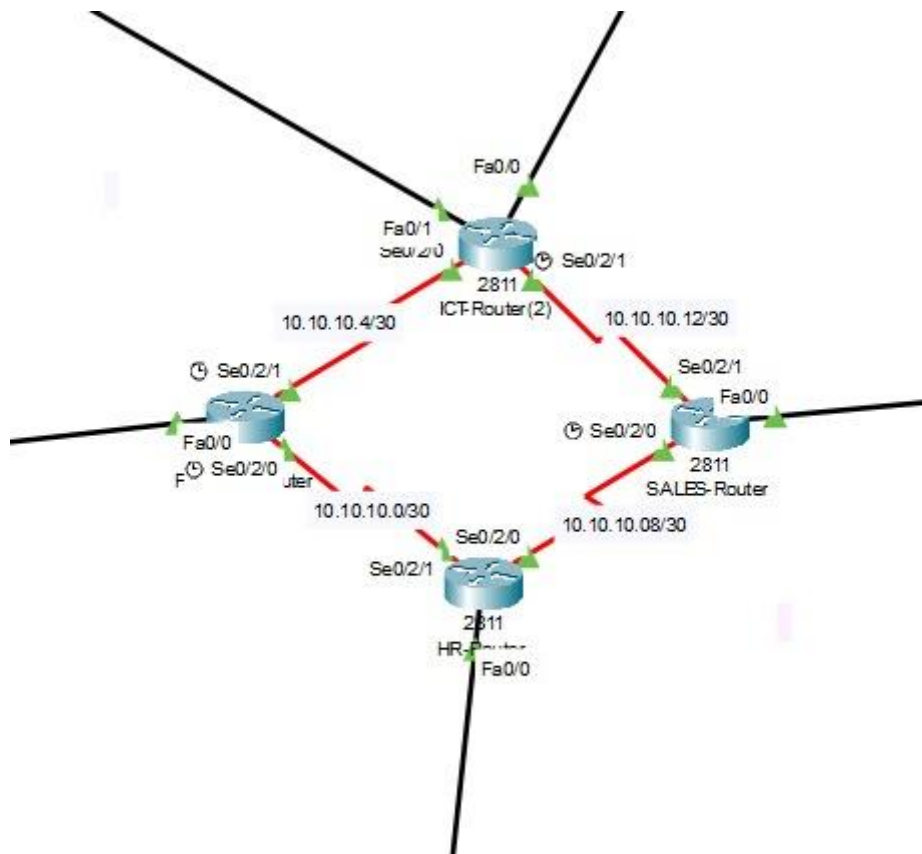

Total Cost: \$41,920

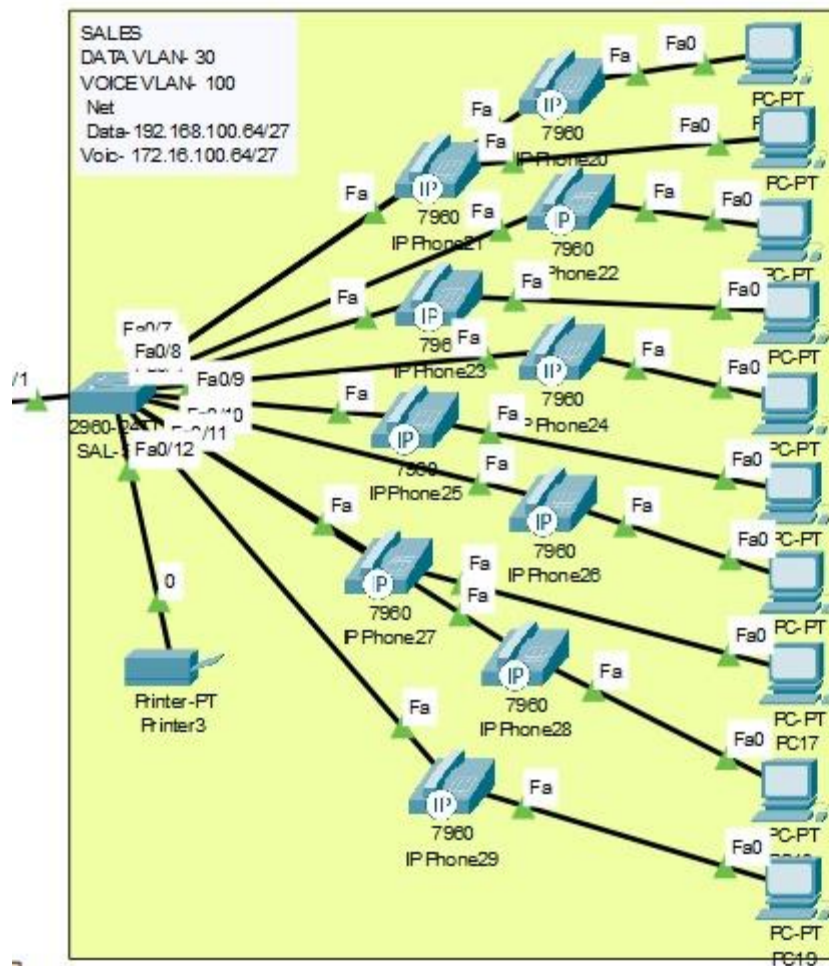

5. Conclusion

This project demonstrates the successful implementation of a VoIP-based telephony network using Cisco Packet Tracer. By designing, configuring, and simulating the network, we showcased how businesses can integrate voice and data communication effectively. The estimated cost of \$41,920 provides a realistic insight into the investment required for real-world

implementation.
